LANGUAGE
Disorders

★ (SLI)... ★

#1

Specific Language Impairment (SLI) occurs when children present language maturation at least 12 months behind their chronological age, in the absence of sensory or intellectual defects, pervasive developmental disorders, evident cerebral damage, and adequate social and emotional conditions

#2

SLI is one of the most common childhood disorders, affecting 7% of children

#3

Moderate to severe language difficulties in young children, particularly those affecting language comprehension, are predictive of long-term problems affecting learning, school achievement, and behavior

#4

Substantial evidence illustrates possible familial transmission of SLI. The incidence in families with a history of SLI is estimated at 20%-40%

★ If you think your child may have a language disorder contact your local Speech Pathologist today! ★
